

# Lecture 8 – Boolean functions

Dr. Aftab M. Hussain,  
Assistant Professor, PATRIOT Lab, CVEST

# Complement of a function

- The complement of a function  $F$  is  $F'$  and is obtained from an interchange of 0's for 1's and 1's for 0's in the value of  $F$  (truth table method)
- The complement of a function may be derived algebraically through DeMorgan's theorems
- Example:  $F = x + y'z$  what is  $F'$ ?
- But what if the function has more terms?
- DeMorgan's theorems can be extended to three or more variables
- The three-variable form of the first DeMorgan's theorem:
$$(x + y + z)' = x'y'z'$$
$$(xyz)' = x' + y' + z'$$
- The generalized form of DeMorgan's theorems states that the complement of a function is obtained by interchanging AND and OR operators and complementing each literal

# Minterms

- A binary variable may appear either in its normal form ( $x$ ) or in its complement form ( $x'$ )
- Now consider two binary variables  $x$  and  $y$  combined with an AND operation
- Since each variable may appear in either form, there are four possible combinations:  $xy, x'y, xy', x'y'$
- Each of these four AND terms is called a *minterm*, or a *standard product*
- In a similar manner,  $n$  variables can be combined to form  $2^n$  minterms
- The binary numbers from 0 to  $2^n - 1$  are listed under the  $n$  variables. Each minterm is obtained from an AND term of the  $n$  variables, with each variable being primed if the corresponding bit of the binary number is a 0 and unprimed if a 1
- A symbol for each minterm is  $m_j$ , where the subscript  $j$  denotes the decimal equivalent of the binary number of the minterm designated

# Maxterms

---

- In a similar fashion,  $n$  variables forming an OR term, with each variable being primed or unprimed, provide  $2^n$  possible combinations, called *maxterms*, or *standard sums*
- Each maxterm is obtained from an OR term of the  $n$  variables, with each variable being unprimed if the corresponding bit is a 0 and primed if a 1, and
- Maxterms are denoted by  $M_j$

# Minterms and Maxterms

## *Minterms and Maxterms for Three Binary Variables*

<b>x</b>	<b>y</b>	<b>z</b>	<b>Minterms</b>		<b>Maxterms</b>	
			<b>Term</b>	<b>Designation</b>	<b>Term</b>	<b>Designation</b>
0	0	0	$x'y'z'$	$m_0$	$x + y + z$	$M_0$
0	0	1	$x'y'z$	$m_1$	$x + y + z'$	$M_1$
0	1	0	$x'yz'$	$m_2$	$x + y' + z$	$M_2$
0	1	1	$x'yz$	$m_3$	$x + y' + z'$	$M_3$
1	0	0	$xy'z'$	$m_4$	$x' + y + z$	$M_4$
1	0	1	$xy'z$	$m_5$	$x' + y + z'$	$M_5$
1	1	0	$xyz'$	$m_6$	$x' + y' + z$	$M_6$
1	1	1	$xyz$	$m_7$	$x' + y' + z'$	$M_7$

It is important to note that:

1. Each maxterm is the complement of its corresponding minterm and vice versa
2. Minterms are 1 for a unique combination of the variables, ie,  $x'y$  is only one when x is 0 and y is 1, in all other cases, it is zero
3. Maxterms are 0 for a single unique combination of variables

# Boolean functions

- Any Boolean function can be expressed algebraically from a given truth table by forming a minterm for each combination of the variables that produces a 1 in the function and then taking the OR of all those terms
- Example:  $f_1 = m_1 + m_4 + m_7$   
$$f_1 = x'y'z + xy'z' + xyz$$
- Thus, any Boolean function can be expressed as a sum of minterms (with “sum” meaning the ORing of terms)

<b><i>x</i></b>	<b><i>y</i></b>	<b><i>z</i></b>	<b>Function <i>f</i><sub>1</sub></b>
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	0
1	1	1	1

# Boolean functions

- Now consider the complement of a Boolean function
- It may be read from the truth table by forming a minterm for each combination that produces a 0 in the function and then ORing those terms

$$f_1' = m_0 + m_2 + m_3 + m_5 + m_6$$

- If we again take a complement, we get  $f_1$  back:

$$f_1 = (m_0 + m_2 + m_3 + m_5 + m_6)'$$

$$f_1 = m_0' m_2' m_3' m_5' m_6'$$

$$f_1 = M_0 M_2 M_3 M_5 M_6$$

<b>x</b>	<b>y</b>	<b>z</b>	<b>Function <math>f_1</math></b>
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	0
1	1	1	1

# Boolean functions

- This shows a second property of Boolean algebra: Any Boolean function can be expressed as a product of maxterms (with “product” meaning the ANDing of terms)
- The procedure for obtaining the product of maxterms directly from the truth table is as follows: Form a maxterm for each combination of the variables that produces a 0 in the function, and then form the AND of all those maxterms

<b><math>x</math></b>	<b><math>y</math></b>	<b><math>z</math></b>	<b>Function <math>f_1</math></b>
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	0
1	1	1	1

# Boolean functions

---

- Are there infinitely many Boolean functions for two independent variables,  $x$  and  $y$ ?
- What are the total number of functions possible for two variables?
- For  $n$  variables?
- We can have  $2^{2^n}$  functions for  $n$  binary variables!
- Thus, for two variables,  $n = 2$ , and the number of possible Boolean functions is 16
- Therefore, the AND and OR functions are only 2 of a total of 16 possible functions formed with two binary variables
- Let us find the other 14 functions and investigate their properties

# Boolean functions

$x$	$y$	$F_0$	$F_1$	$F_2$	$F_3$	$F_4$	$F_5$	$F_6$	$F_7$	$F_8$	$F_9$	$F_{10}$	$F_{11}$	$F_{12}$	$F_{13}$	$F_{14}$	$F_{15}$
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
1	0	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

- Constant functions: 0 and 1
- AND and OR –the well-known logic functions
- Transfer functions:  $x$  and  $y$
- Complement functions:  $x'$  and  $y'$

# Boolean functions

<i>x</i>	<i>y</i>	<i>F</i> <sub>0</sub>	<i>F</i> <sub>1</sub>	<i>F</i> <sub>2</sub>	<i>F</i> <sub>3</sub>	<i>F</i> <sub>4</sub>	<i>F</i> <sub>5</sub>	<i>F</i> <sub>6</sub>	<i>F</i> <sub>7</sub>	<i>F</i> <sub>8</sub>	<i>F</i> <sub>9</sub>	<i>F</i> <sub>10</sub>	<i>F</i> <sub>11</sub>	<i>F</i> <sub>12</sub>	<i>F</i> <sub>13</sub>	<i>F</i> <sub>14</sub>	<i>F</i> <sub>15</sub>
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
1	0	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

- NAND and NOR –these are complementary functions to the usual AND and OR functions
- Take the AND/OR and then take the complement
- NAND is represented by  $\uparrow$  and NOR is represented by  $\downarrow$
- $x \uparrow y = (x \cdot y)'$  and  $x \downarrow y = (x + y)'$

# Boolean functions

<i>x</i>	<i>y</i>	<i>F</i> <sub>0</sub>	<i>F</i> <sub>1</sub>	<i>F</i> <sub>2</sub>	<i>F</i> <sub>3</sub>	<i>F</i> <sub>4</sub>	<i>F</i> <sub>5</sub>	<i>F</i> <sub>6</sub>	<i>F</i> <sub>7</sub>	<i>F</i> <sub>8</sub>	<i>F</i> <sub>9</sub>	<i>F</i> <sub>10</sub>	<i>F</i> <sub>11</sub>	<i>F</i> <sub>12</sub>	<i>F</i> <sub>13</sub>	<i>F</i> <sub>14</sub>	<i>F</i> <sub>15</sub>
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
1	0	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

- Exclusive OR (XOR) returns 1 only if one of *x* or *y* is 1, it is 0 if both are one
- This is represented by the symbol  $\oplus$
- $x \oplus y = x'y + y'x$
- The complement of this is XNOR or Equivalence (is *x*=*y*?)

# Boolean functions

<i>x</i>	<i>y</i>	<i>F</i> <sub>0</sub>	<i>F</i> <sub>1</sub>	<i>F</i> <sub>2</sub>	<i>F</i> <sub>3</sub>	<i>F</i> <sub>4</sub>	<i>F</i> <sub>5</sub>	<i>F</i> <sub>6</sub>	<i>F</i> <sub>7</sub>	<i>F</i> <sub>8</sub>	<i>F</i> <sub>9</sub>	<i>F</i> <sub>10</sub>	<i>F</i> <sub>11</sub>	<i>F</i> <sub>12</sub>	<i>F</i> <sub>13</sub>	<i>F</i> <sub>14</sub>	<i>F</i> <sub>15</sub>
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
1	0	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

- Inhibition function: *x* but not *y* (*F*<sub>2</sub>), and *y* but not *x* (*F*<sub>4</sub>)
- *x* but not *y*: If *y* is LOW then what is *x*?
- It is represented by a /
- $x/y = xy'$

# Boolean functions

$x$	$y$	$F_0$	$F_1$	$F_2$	$F_3$	$F_4$	$F_5$	$F_6$	$F_7$	$F_8$	$F_9$	$F_{10}$	$F_{11}$	$F_{12}$	$F_{13}$	$F_{14}$	$F_{15}$
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
1	0	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

- Implications:  $x$  implies  $y$  ( $F_{13}$ ), or  $y$  implies  $x$  ( $F_{11}$ )
- This tells us whether the variables  $x$  and  $y$  are following the *given* implication rule
- It is not for determining whether the two variables form an implication rule between them

# Boolean functions

Boolean Functions	Operator Symbol	Name	Comments
$F_0 = 0$		Null	Binary constant 0
$F_1 = xy$	$x \cdot y$	AND	$x$ and $y$
$F_2 = xy'$	$x/y$	Inhibition	$x$ , but not $y$
$F_3 = x$		Transfer	$x$
$F_4 = x'y$	$y/x$	Inhibition	$y$ , but not $x$
$F_5 = y$		Transfer	$y$
$F_6 = xy' + x'y$	$x \oplus y$	Exclusive-OR	$x$ or $y$ , but not both
$F_7 = x + y$	$x + y$	OR	$x$ or $y$
$F_8 = (x + y)'$	$x \downarrow y$	NOR	Not-OR
$F_9 = xy + x'y'$	$(x \oplus y)'$	Equivalence	$x$ equals $y$
$F_{10} = y'$	$y'$	Complement	Not $y$
$F_{11} = x + y'$	$x \subset y$	Implication	If $y$ , then $x$
$F_{12} = x'$	$x'$	Complement	Not $x$
$F_{13} = x' + y$	$x \supset y$	Implication	If $x$ , then $y$
$F_{14} = (xy)'$	$x \uparrow y$	NAND	Not-AND
$F_{15} = 1$		Identity	Binary constant 1
